# Introduction of Navigation

> Navigation is a Widget that guides users to page jumps

Usage of Navigation

Navigation paths are divided into two types, one is user-defined and the other is the upper level of the resource.

1. user-defined

The user-defined url can be an **existing user interface** or **any web page**. After configuration, click `apply` button in Edit page.

Then click the `Navigation` button on the main page, the URL will be displayed, click the corresponding link to open the corresponding website.

2. ParentPath

After entering the url of the resource, Widget will navigate according to the level of the resource.

For instance: if url is */bedroom/waterheater/A*

ParentPath will be:

```
          */bedroom/waterheater/*

          */bedroom/airConditioner/*

          */bedroom/ElectricMosquitoSwatter/*
```

```
*/bedroom/*
```

Click on the resource link to enter a blank main page, and then website will automatically display a corresponding Widget based on this resource.
